

FIS/fci customers and potential customers

The following document gives you a short overview of the new *FIS/fci* 2017 Release. For further information, please contact our product management:

produktmanagement@fis-gmbh.de

FIS/fci – the Benefits

The *FIS/fci* document recognition imports images from diverse entry channels (e.g. from a standard scan client, as a PDF document via e-mail or in the ZUGFeRD format).

For incoming invoices, relevant invoice header and item data are extracted via a “free form recognition” technology. The invoice reading software validates any information read by using vendor master data (and, if required, article and purchase order master data) and offers validation functions for contents that are unclear or identified as ambiguous.

The data is read using a set of rules supported by “Fuzzy” technology (fuzzy matching) and an intelligent knowledge database. The document reading software is able to update vendor information (items, formats, key words) in the knowledge database automatically and continuously. *FIS/fci* applies this knowledge to all invoices from the vendor in order to guarantee high recognition rates

The solution is available for scanning and processing invoices, delivery notes, order confirmations, sales orders, payment advice notes, vendor statements and general documents. All these solutions are based on the same software architecture and can be easily combined with the different *FIS/edc* monitors in the SAP system to create a complete document processing solution.

Highlights of the *FIS/fci* document recognition

The *FIS/fci* document recognition is able to extract business-relevant data from invoices or other document types. Moreover, the processing throughput can be increased by up to 200 %.

Highlights of the document reading software

- Genuine free form recognition technology – pre-conditioned to search for relevant document data
- High recognition rates right from the first invoice
- Self-learning system/intelligent knowledge database
- Vendor recognition > 95%
- Reading of line item data
- Automatic check: e. g. §14 UStG (turnover tax law); totals, taxes, country-specific requirements etc.

2. FIS/fci

Technology

Document entry processing has been streamlined. Data is exchanged between the *FIS/fci* and *FIS/edc* components directly via Web service communication, which simplifies administration.
